Treat the Disease with Adequan Canine

With Adequan[®] Canine (polysulfated glycosaminoglycan), you have a way to proactively treat canine osteoarthritis (OA) and not just manage or control clinical signs of the disease. It's the only FDA-approved drug proven to treat the disease of canine arthritis AND its clinical signs – like pain and inflammation.¹ Adequan Canine is recommended for intramuscular injection for the control of signs associated with non-infectious degenerative and/or traumatic arthritis of canine synovial joints.

Early Treatment Can Make a Difference

Pet owners may not be aware of the subtle changes that could signal their dog is experiencing joint pain. Prescribing Adequan Canine early, when first diagnosed, before cartilage wears away completely, can help improve patient outcomes.

Without treatment, arthritis can cause the deterioration of joint cartilage, and surrounding tissue and fluid; leading to bone-on-bone contact, chronic inflammation, and the loss of mobility.²
